

Western Health

Clinical Trials at Western Health

Western Health conducts a number of clinical trials, working with research participants to test treatments in areas of medicine including cancer, cardiology, neurology, diabetes and endocrinology and renal.

Clinical trials are scientific studies that help researchers develop new medication and other strategies to treat and prevent disease.

Benefits of participating in clinical trials may include: early access to new medicines not otherwise available, receiving close monitoring of your health, and contributing to the development of future life-changing treatments.
